

SUMMARY

CompTIA Network+ certified IT support and cybersecurity-focused professional with hands-on experience in cloud infrastructure (Azure), enterprise network design, and scripting/automation (Python).

TECHNICAL SKILLS

- **Networking:** OSI Model, TCP/IP, Subnetting, VLANs, Routing & Switching, DNS, DHCP, VPNs
- **Systems:** Windows, Linux/UNIX, Bash scripting
- **Development:** JavaScript, Python, C/C++, React, HTML5/CSS3
- **Tools:** Wireshark, Cisco Packet Tracer, Git/GitHub, VS Code

HANDS-ON PROJECT EXPERIENCE

Enterprise Network Design & Troubleshooting — Cisco Packet Tracer

- Designed and built a 3-site enterprise WAN (headquarters + 2 branch offices, 8 devices) in Cisco Packet Tracer, implementing VLAN segmentation, single-area OSPF dynamic routing, and centralized NAT/PAT for Internet access.
- Diagnosed and resolved a simulated 3-fault, multi-site outage (OSPF area mismatch, ACL misconfiguration, trunk failure) using a structured, evidence-based troubleshooting methodology grounded in show/diagnostic commands.
- Produced full technical documentation to industry standard: network topology and cabling diagrams, IP addressing/VLAN plans, verified device configurations, and a 36-case test plan covering routing, security, DHCP, and failover scenarios.

Cloud Infrastructure — Azure 3-Tier Web Application

- Designed and deployed a segmented 3-tier architecture on Azure, separating web and data tiers into isolated subnets to prevent direct internet access to the database layer
- Configured Network Security Groups to enforce least-privilege traffic rules, restricting SSH access to a single trusted IP and limiting database access to the application subnet only
- Provisioned and secured an Azure SQL Database using VNet service endpoints instead of public access, reducing the attack surface of the data tier
- Implemented IAM role assignments following least-privilege principles, scoping access by resource group rather than granting subscription-wide permissions

Scripting/Automation — System Health Check & Reporting Tool

- Built a cross-platform Python tool to automate system health monitoring (CPU, memory, disk usage), eliminating manual server checks
- Implemented configurable alert thresholds and automated email notifications for systems exceeding safe operating limits
- Applied secure coding practices by externalizing credentials to environment variables rather than hardcoding secrets in source
- Scheduled the tool via cron/Task Scheduler for unattended hourly execution, converting a manual process into a fully automated one

CERTIFICATIONS

- **CompTIA Network+** (Certified, 2026)

EDUCATION

Conestoga College

Software Engineering Technician | Class of 2024
